

From economical point of view, most renewable energy sources currently show competitive economical properties in comparison with conventional sources, especially if their true lifecycle costs are taken into consideration. This multidisciplinary book focuses on the evaluation of the techno-economic performances of photovoltaic and wind energy systems. Various modes of operation are considered. These modes include grid-connected and off-grid applications. In addition, various types of loads are considered, including non-deferrable and deferrable loads. Viable techno-economic performance and optimization of Renewable Energy Systems (RESs) for economic performance maximization is among the main objectives of this reference. The book is written for students, researchers, and relevant specialists. Nineteen authors contributed to this book. They are from seven countries; Egypt, Turkey, Croatia, Mexico, Germany, Algeria, and Norway. The authors are: M. EL-Shimy (ed.), H. Balcioglu, K. Soyer, M. A. Abdelraheem, M. Said, M. Noor, T. Abdo, B. Đurin, J.G. Vargas-Hernández, A.C. Rangel, L. Nađ, K. Pallagst, P. Hammer, N. Bailek, K. Bouchouicha, A. Slimani, N. Aoun, A. Razagui, and N. Veggeland.

Renewable Energy Economics, May 2017

Mohamed EL-Shimy (Ed.)

Economics of Variable Renewable Sources for Electric Power Production

Prof. Dr. Mohamed EL-Shimy is a professor with the depart. of Electrical Power and Machines – Ain Shams University. He is also an electromechanical specialist, and a freelance trainer. He is a technical reviewer for some major journals.

ECONOMICS OF VARIABLE RENEWABLE SOURCES FOR ELECTRIC POWER PRODUCTION

Mohamed EL-Shimy M. Bekhet (editor)

Professor of electric power systems

Ain Shams University

Cairo, Egypt

May, 2017

To my wife Hala, and my children (Sara, Malak, Omar, and Aly)

List of Contributors

The contributors ordered as they appear in the book are as follows.

- Mohamed EL-Shimy M. Bekhet (editor)** Professor of Electric Power Systems, Electrical Power and Machines Department, Faculty of Engineering, Ain Shams University, Cairo, Egypt.
Tel.: 00201005639589; Email: mohamed_bekhet@eng.asu.edu.eg; shimymb@yahoo.com
Website: <http://shimymb.tripod.com>
- Hasret Balcioğlu** Professor. Director of the Institute of Graduate Studies and Research, Head of the Department of Business Administration, Faculty of Economics and Administrative Sciences, Cyprus International University, North Cyprus, Mersin 10 Turkey.
Tel: 0090 3926711111; E-mail: hbenar@ciu.edu.tr
- Kemal Soyer** PhD candidate. Institute of Graduate Studies and Research, Cyprus International University, North Cyprus, Mersin 10 Turkey
Email: ksoyer@ciu.edu.tr
- Mohamed A. Abdelraheem** Professor of Electric Power Systems, Electrical Power and Machines Department, Faculty of Engineering, Ain Shams University, Cairo, Egypt.
Tel.: 002-01222184828. Email: m_aal666333@hotmail.com
- Mohamed Said** Electrical engineer; The Egyptian airports company (EAC), Egypt
Email: engmohamedsaid2009@gmail.com
- Mohamed Noor** Professor, Hydraulics and Irrigation Department, Faculty of Engineering, Ain Shams University
Email: mhmdnour2@hotmail.com

TABLE OF CONTENTS

LIST OF CONTRIBUTORS	3
PREFACE	13
PART 1: OVERVIEW OF RENEWABLE ENERGY SYSTEMS	16
1 Renewable Energy - Background	17
1.1 Introduction	17
1.2 Renewable Energy Resources and Sources	20
1.3 Renewable Energy around the World	27
2 Techno-economic modeling and analysis of renewable energy projects	35
2.1 Introduction	35
2.2 Financial and economic performance indicators	37
2.2.1 Simple Payback	37
2.2.2 Annual Energy/Cost Savings	37
2.2.3 Time Value of Money	40
2.2.4 Inflation Rate	42
2.2.5 Present Value Annuity Factor (PVAF)	43
2.2.6 Net Present Value (NPV)	43
2.2.7 Internal Rate of Return (IRR)	44
2.2.8 Discount Rate	45
2.2.9 Return on Equity (ROE)	49
2.2.10 Cash Return On Assets Ratio	49
2.2.11 Equity payback	49
2.2.12 Benefit Cost Ratio (BCR)	49
2.3 Basic Cashflow	50
2.4 Levelized Cost of Energy (LCOE)	50
2.5 Breakeven or Grid Parity analysis	55
2.6 SWOT Analysis	57
3 Operational Characteristics of Renewable Sources, Challenges, and Future Prospective	63
3.1 Introduction	63
3.2 Simplified Energy Production Estimation	70
3.2.1 Solar-PV Generators	70
3.2.1 Wind Turbine Generators (WTGs)	73
3.3 Energy Storage for Power Balance	75
3.3.1 Energy Storage Options	76
3.3.2 Approximate modeling of P2H2P systems	89
PART 2: TECHNO ECONOMIC ANALYSIS AND OPTIMIZATION OF GRID CONNECTED SOLAR-PV AND WIND ENERGY PRODUCTION SYSTEMS	99

4 Detailed Techno-economic Analysis of Solar-PV Projects – Egypt Case Studies	101
Nomenclature	101
4.1 Introduction	105
4.2 Modeling of LCOE and Grid Parity	111
4.3 Case Studies, Results and Discussion	124
4.3.1 Base Case	124
4.3.2 Sensitivity Analysis	127
4.3.3 Technological and Locational Impacts on Energy Production and LCOE	130
A. Technological Impact (sun tracking and PV technology)	133
B. Locational Impact:	139
4.4 Grid Parity Analysis	145
5 Optimization of Wind Energy Projects for Viability Maximization Considering External Costs	147
Nomenclature	147
5.1 Introduction	147
5.2 Problem Statement and Mathematical Modeling	156
5.2.1 Modeling the LCOE:	157
5.2.2 Energy production and output power curve models	160
5.2.3 Correction of the Weibull PDF parameters	169
5.2.4 Optimal site matching of WTGs	172
5.3 Case Study	176
5.3.1 Selection of the study sites and data adaptation	176
5.3.2 Results and Discussion	183
A. Optimal Site Matching of WTGs	183
B. Energy production estimation	187
C. Estimation of the LCOE	196
D. Grid parity analysis	201
D. Optimal Selected Commercial Wind Turbines:	205
Appendix A: Estimation of the Weibull Parameters	209
Appendix B : WTG Power Curve Models	214
Appendix C: Spectrum of main parameters of commercial WTGs and their relative frequency of occurrence	217
6 Comparison Between the Economic Performances of Wind and Solar-PV Projects Considering External Costs	221
Nomenclature	221
6.1 Introduction	221
6.2 Results and Discussions:	225
6.3 Grid parity analysis	234

6.4 Conclusions	236

PART 3: TECHNO ECONOMIC ANALYSIS OF VARIABLE RENEWABLE SOURCES SUPPLYING DEFERRABLE LOADS	241
7 Overview of Pumping Systems with Focus of Deferrable Irrigation Loads	243
Nomenclature	243
7.1 Introduction	249
7.2 Types of pumps	253
7.2.1 Direct Lifting Devices	254
A. Reciprocating and cyclic direct lifting devices	254
B. Rotary direct lifting devices	254
7.2.2 Positive displacement pumps “PD”	254
A. Reciprocating Displacement Pumps	255
B. Rotary Displacement Pumps	255
7.2.3 Roto-Dynamic Pumps “RD”	256
A. Centrifugal Pumps “CP”	256
7.2.4 Air Lift Pumps	259
7.2.5 Impulse (Water Hammer) Devices	259
7.3 Water Lifting Devices and Pumps for Irrigation System	259
7.4 Selection Conditions of Pump	263
7.5 Basics of pump operating characteristics	266
7.5.1 Pump head (Total Dynamic Head)	266
A. Total Static Head (H _s)	267
B. Pressure Head (H _p)	267
C. Velocity Head (H _v)	269
D. Friction Head (H _f)	269
7.5.2 Pump Performance Curves	270
A. Positive Displacement (PD) Pumps	270
B. Centrifugal Pumps	272
7.5.3 Pump Operating Point	273
7.5.4 Pump Performance Calculation	274
7.6 Pump Drivers	276
7.6.1 Internal Combustion (I.C) Engines	276
A. Types of I.C Engines	277
B. Electrical Motors	277
B.1 Synchronous Motors	278
B.2 Induction Motors	278

B.3 Variable Frequency Drives VFD	279
C. Solar PV Power	279
7.7 Pump selection for a specific application	282
7.7.1 Define Requirements	282
7.7.2 Define the System Operating Conditions	282
7.7.3 Define the Pump Rated Point	282
7.8 Types of Irrigation Systems	283
7.8.1 Surface Irrigation Method	285
7.8.2 Sprinkler Irrigation Method	287
7.8.3 Micro-Irrigation System	288
7.9 Irrigation Water Requirements	290
7.9.1 Evapotranspiration Concepts	292
A. Reference Crop Evapotranspiration (ET_o)	293
B. Crop Evapotranspiration under Standard Conditions (ET_c)	293
C. Crop Evapotranspiration under Non-Standard Conditions ($ET_{c Adj}$)	294
E. Determination of Evapotranspiration	294
D.1 Measurement of Evapotranspiration (ET)	294
D.2 Computation of Evapotranspiration from Meteorological data	295
D.3 ET estimated from Pan Evaporation	295
D.4 Blaney-Criddle Method	296
D.5 FAO-Penman-Monteith Equation	297
7.9.2 Estimation of the Crop Coefficients	303
A. Initial Growth Stage	304
B. Other Growth Stages	304
8 Viability And Emission Analysis of Various Energy Supply Options for Irrigation Water Pumping Systems	309
Nomenclature	309
8.1 Introduction	309
8.2 SWOT Analysis	316
8.2 Solar-PV Water Pumping System Configuration	319
8.3 Mathematical Modeling of the System	321
8.3.1 Solar Energy Modeling	321
8.3.2 Solar-PV Array Model	327
A. Maximum Power Point Tracking (MPPT) Technique	329
B. Inverter model	332
D. Motor Type and Model	334

E. Pump Model	338
F. Irrigation Water Distribution Systems	340
G. Evaluation of the Optimal Tilt Angle and sun tracking	343
8.4 System Sizing approach	346
8.5 Levelized Cost of Energy LCOE	351
8.6 The True Cost of Electricity Generation Technologies	356
8.7 Green House Gases (GHG) analysis	357
8.8 Methodology	361
8.9 A Standalone PV Water Pumping System	364
8.10 Diesel Engine Based Water Pumping System	368
8.11 Electricity grid based water pumping system	372
8.12 Analysis of the Study Site	373
8.12.1 Meteorological Data	373
8.12.2 Hydraulic Energy Demand	376
8.13 Results	380
8.13.1 Correlation Models Result	380
8.13.2 Optimal Tilt Angle Results	380
8.13.3 Effect of the Optimal Tilt Angles on Ht	385
8.13.4 Sizing Approach Results	387
8.13.5 COE and LCOE Results	389
8.13.6 Green House Gases (GHS) analysis	391
8.14 Conclusion	392
9 Generalized method for sizing optimization of standalone 100% renewable energy mixed source for supplying deferrable loads	395
9.1 Introduction	395
9.2 Problem Statement and Formulation	398
9.2.1 Sizing of Variable Sources Supplying Deferrable Loads – Basic Concepts	398
9.2.2. Sizing Optimization of Solar-PV Arrays	400
9.2.3 Sizing Optimization of Wind Farms	402
9.2.4 Sizing Optimization of Mixed Wind and Solar-PV	403
9.2.5 Hydraulic Energy Demand Modeling	404
9.2.6. Design Month Selection	405
9.3 Application Example	405
9.3.1. Location, Input Data	405
9.3.3. Technological Selection	410
9.3.4. Optimization Results	411
A. Standalone solar-PV generator	411

B. Standalone wind generator	412
C. Mixed solar-PV and wind generators	413
9.4 Conclusions	414
Appendix 1: Detailed Meteorological data of the study site	416
Appendix 2: Costs of solar-PV and WTG sources	419
A. Solar-PV components	419
B. Conventional horizontal axis WTG	419
C. WindTronics WTG	420
Appendix 3: Evaluation of various solutions	421
PART 4: INTERNATIONAL EXPERIENCES AND MISCELLANEOUS TOPICS	425
10 Cost and Benefit Analysis of Using Solar Energy to Produce Electricity in North Cyprus	427
10.1 Summary	427
10.2 Introduction	428
10.3 Energy Sector in NC	429

PREFACE

Renewable energy sources (RESs) are essential for the future energy security. These energy sources provide a viable alternative energy, and cost effective sources in various types of electric energy grids such as utility grids, smart grids, and microgrids. In addition, RESs are currently considered as a feasible techno-economic alternative for supplying remotely located off-grid electric and non-electric energy loads.

RESs are freely abundant and accessible, and environmentally friendly; however, the widespread use and large-scale integration of renewable energy systems to electric power systems face three critical challenges. These categories cover the main operational, dynamical, and economical prospective.

From electricity grid operation point of view, the popular renewable sources have high and risky levels of variability, intermittency, resource predictability, interface controllability, and economic generation dispatchability. These inherent problems are mainly attributed to the stochastic and varying nature of renewable energy sources as well as the inherent uncontrollability of the input natural resources (such as wind speed or solar radiation) and the impossibility of storing them in their natural form. Many approaches are proposed for reducing these operational problems. These approaches include geographical diversity, interconnections between systems, energy storage, distributed renewable sources, and smart grids. More details about the operational characteristics of variable RESs are presented in Chapter 3. In addition, the chapter includes suggestions for 100% renewable energy sources based on the power-to-gas-to-power conversions. These energy conversions minimize the inherent operational characteristics of variable energy sources.

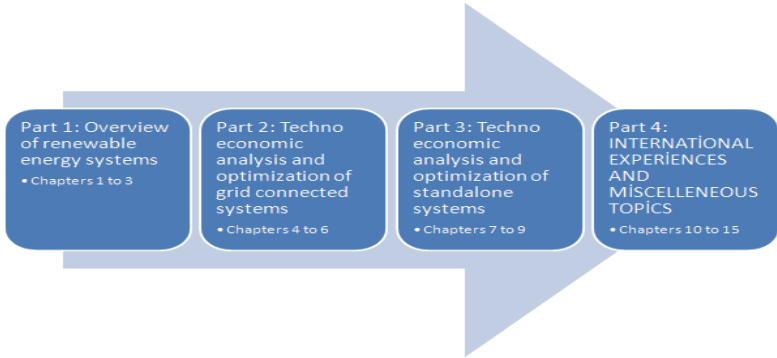

From dynamical point of view, the behaviors of the host power grid are significantly modified by the dynamic characteristics, control settings, and switching of converters utilized in the grid interface of the generators, the active elements in the power networks, and the dynamic loads as well as their interactions. In comparison with conventional synchronous generators,

renewable energy includes a massive number of technologies, each of which has different technological structural, control capabilities, and dynamical properties. Therefore, the dynamic behavior of renewable energy sources as well as their interaction with power systems is highly different in comparison with conventional synchronous generators. This situation requires continuous updating of the models to cope with these technologies and assessment of their impacts on power systems for various themes of power system studies. The dynamical issues of RESs and their impacts on power grids are out of the scope of this textbook; however, numerous previous publications effectively handle these issues. The readers may refer to the following textbooks for recent details about the dynamical behavior of electric power systems and RESs.

1. M. EL-Shimy. *Dynamic Security of Interconnected Electric Power Systems - Volume 1*. Lap Lambert Academic Publishing / Omniscryptum GmbH & Company Kg; Germany; ISBN: 978-3-659-71372-9; May, 2015.
2. M. EL-Shimy. *Dynamic Security of Interconnected Electric Power Systems - Volume 2: Dynamics and stability of conventional and renewable energy systems*. Lap Lambert Academic Publishing / Omniscryptum GmbH & Company Kg; Germany; ISBN: 978-3-659-80714-5; Nov. 2015.

From economical point of view, most renewable energy sources currently show competitive economical properties in comparison with conventional sources, especially if their true lifecycle costs are taken into consideration. This book focuses on the evaluation of the techno-economic performances of solar-PV and wind energy systems. Various modes of operation are considered. These modes include grid-connected and off-grid applications. In addition, various types of loads are considered, including non-deferrable and deferrable loads. Viable techno-economic performance and optimization of Renewable Energy Systems (RESs) for economic performance

maximization is among the main objectives of this textbook. This book consists of four parts as illustrated in the following figure.

For the convenience of the readers, each part is constructed as self contained structure with minor dependence on the surrounding parts. We hope that this multi-disciplinary book will provide a significant support to students and researchers as well as various related specialists. We welcome any supporting feedback from the readership.

M. EL-Shimy
